

## Instructions of use

Version 1.1, September 2018

## Product name: Quick - Stick

Use: Disinfection.

### Description

Unstabilised Calcium Hypochlorite in 300 g plastic wrapped stick/tablet. "Quick-Stick" is used for continuous chlorination of the pool, where the plastic wrapping minimises the exposed area, slowing down the dissolution rate. Do not remove the plastic cover from the stick before use, as it provides an even addition of disinfectant to the pool.

### Instructions of use

1. Measure the pH of the water with the pool and adjust, if necessary, to pH 7,2-7,6.
2. Add one "Quick-Stick" per 25 m<sup>3</sup> of water.
3. Add the "Quick-Stick" to the flow-through chlorinator or in a dosing sleeve in the skimmer.

Direct contact with the pool can cause discoloration of the liner.

If the chlorine content is to be raised immediately, e.g. for shock chlorination, the product "Granulate" is recommended.

Measure the chlorine content periodically and keep it between 1-3 mg/l.

Before using the product, you should read the instructions and safety data sheet.
